Live service · The Olive Room · Zamalek, Cairo

Run the room.

Resuto runs everything else.

One operating system for the whole restaurant: AI setup, a living floor plan,
guest ordering, kitchen flow, split payments and an AI manager watching the
service with you.

Restaurant service breaks at the handoffs

A reservation, table, order, kitchen ticket and payment often live in separate workflows

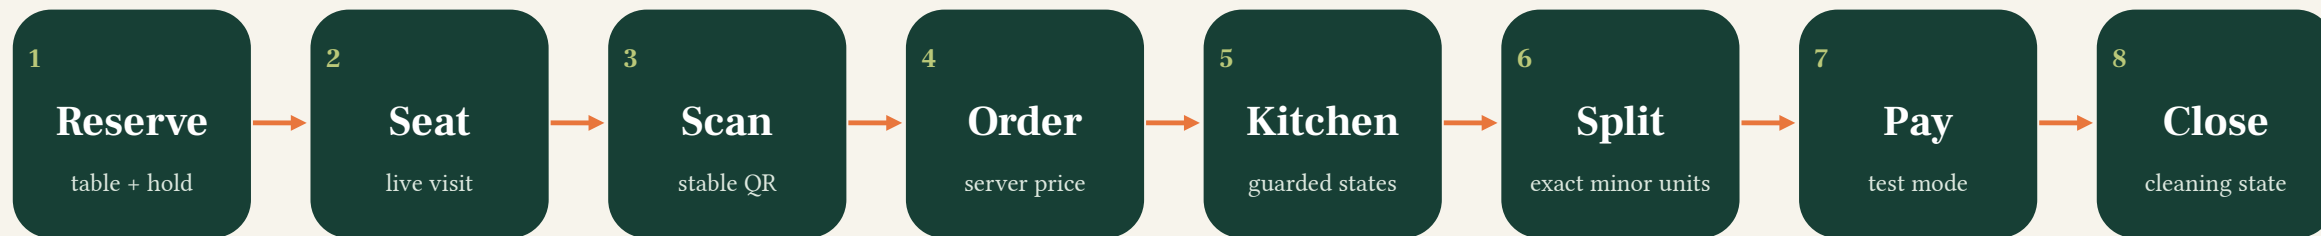

First customer Independent restaurants and small groups in Egypt that need an Arabic-first operating system without enterprise overhead

The problem remains a credible operating hypothesis until interviews and pilot baselines quantify it.

One state follows the guest through service

Green steps run in the current MVP; outlined gates require production validation

The connection creates the value

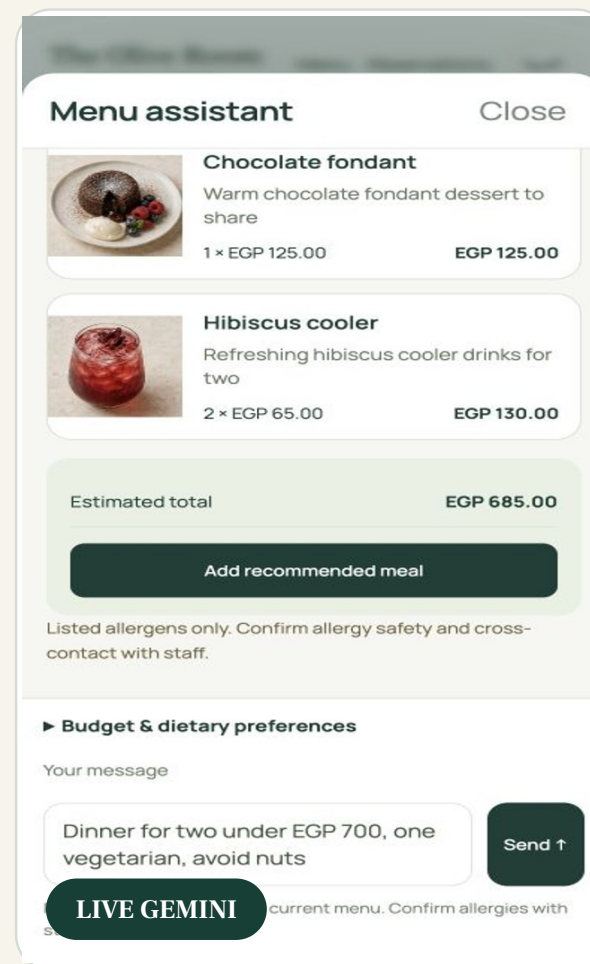

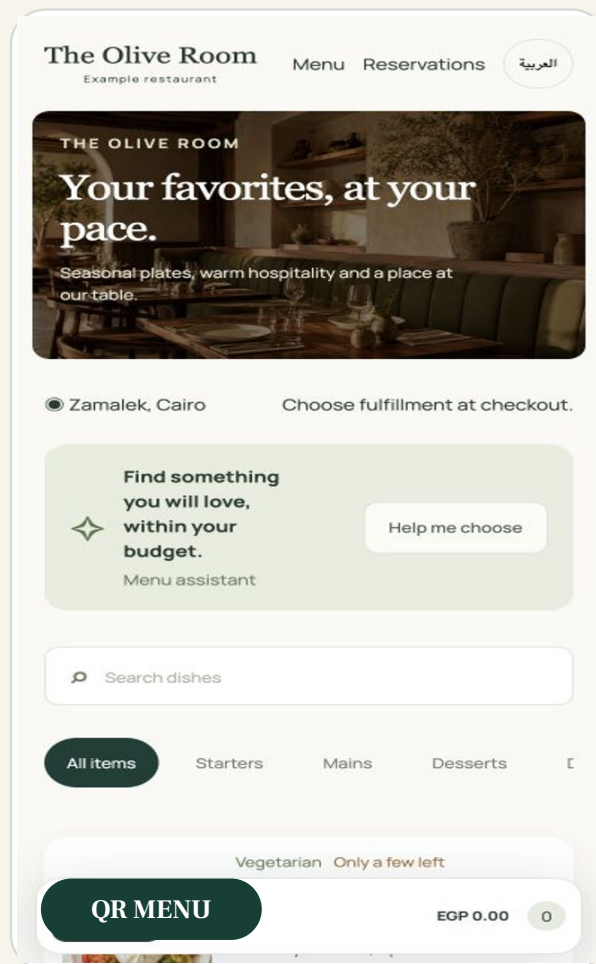

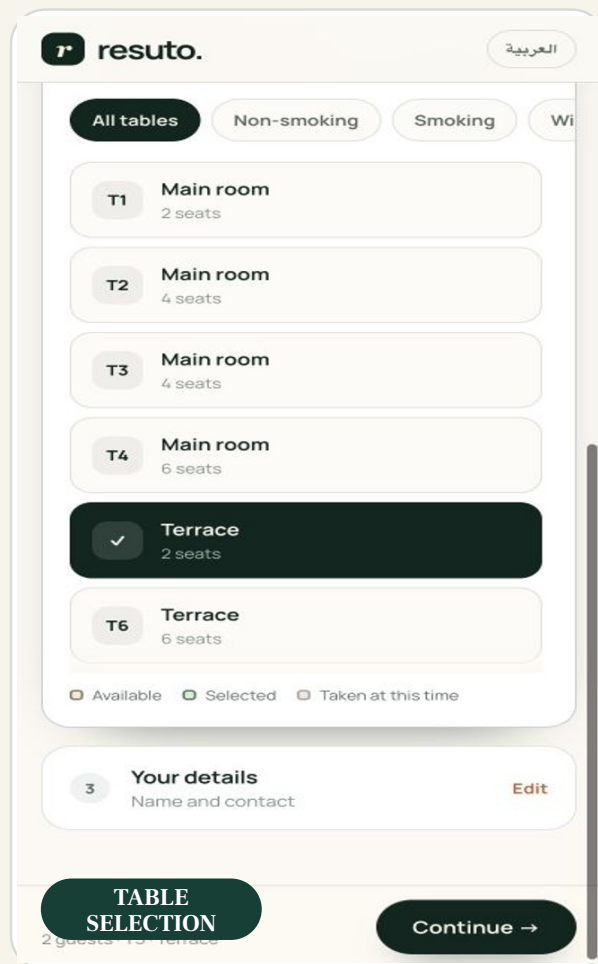

One floor geometry drives reservation choice and table identity. One order state updates the kitchen. One bill state controls payment and closeout.

Production gates

Live merchant acceptance
 Firebase emulator isolation run
 Operational monitoring and recovery

Guests choose the table, then order in context

The same live menu supports English, Arabic and a constrained Gemini assistant

Three
proofs

01

Exact table

02

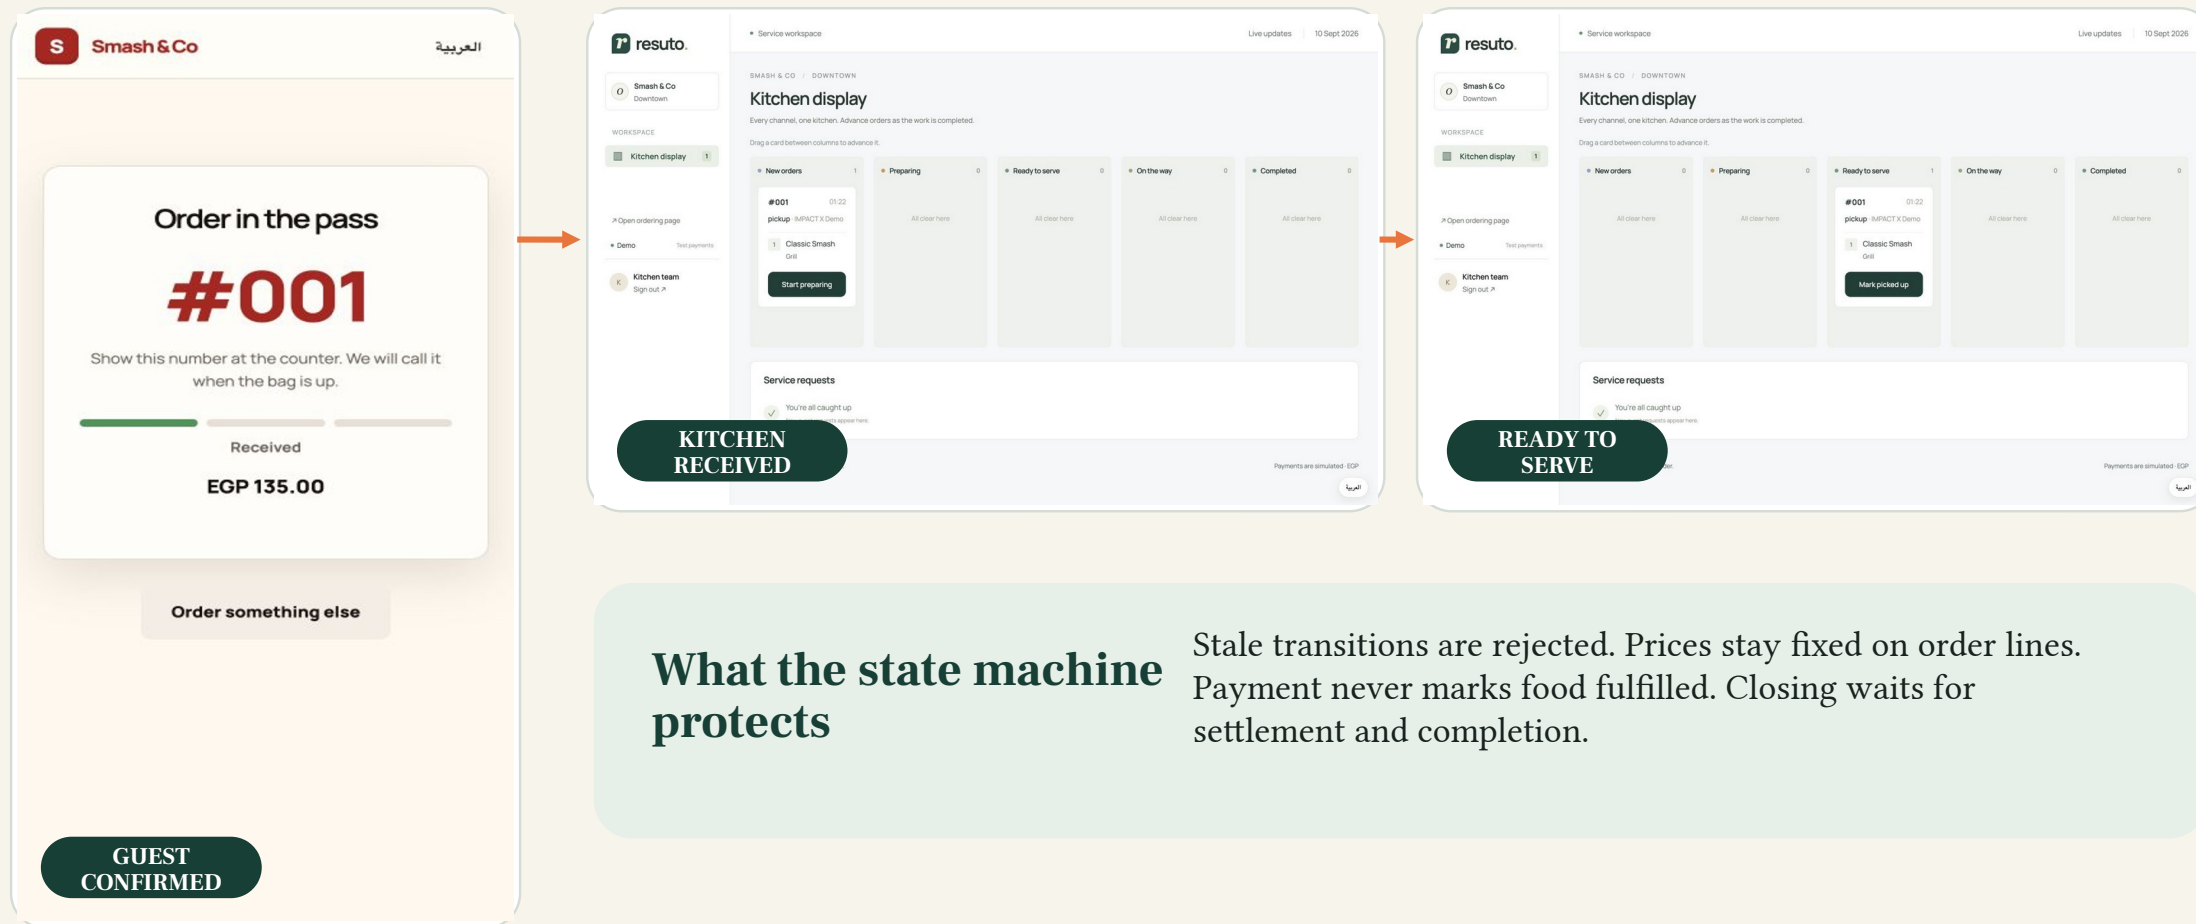

Readable
menu

03

Budget held

Order #001 moved from guest confirmation to ready

A synthetic pickup order exercised the real state transition; checkout stayed visibly in test mode

What the state machine protects

Stale transitions are rejected. Prices stay fixed on order lines. Payment never marks food fulfilled. Closing waits for settlement and completion.

TEST PAYMENT MODE Stripe and Paymob adapters plus signed callback validation exist, but no live merchant acceptance was performed.

Gemini drafts decisions; people approve the action

Two live uses were verified: guest recommendations and manager menu extraction

Menu assistant

Fallback is part of the product

Provider failure returns labeled demo rules. No draft publishes automatically.

One domain model, two verified persistence paths

Local demo uses SQLite; hosted tenant mode uses Firebase Authentication and Firestore

Defensible controls

HTTP-only SameSite sessions locally · Firebase ID token verification in tenant mode · server-side price and stock checks · idempotent payments · optimistic revisions

TENANT CODE IMPLEMENTED

The Firebase emulator isolation test was skipped in today's full suite and remains a release gate.

The pilot converts operating hypotheses into evidence

Targets describe success thresholds, not achieved results

3

restaurants

7

baseline days

23

operating days

5

core KPIs

SDG 8

Restaurant
productivity and
more reliable work

Activation

— Time from setup to first complete order

Order accuracy

— Corrections or cancellations caused by error

Kitchen cycle

— order_sent to kds_ready

Settlement

— bill_requested to payment_closed

Team adoption

— Share of orders in system + weekly CSAT

Pilot thresholds

**80% of orders routed
through Resuto**

**10% improvement in at
least two KPIs**

Team CSAT of 4/5

The source PDF's RTL inequality glyph order is ambiguous; thresholds are written here as plain language.

Egypt first, paid per branch

The price buys the connected operating flow; Saudi Arabia opens only after compliance gates

Growth

EGP 1,499

per branch / month · before tax

Includes

Reservations, tables, QR ordering, kitchen display, split bills, customer data, AI assistant and basic integrations

30-DAY PILOT · NO SETUP FEE

Who pays

The restaurant owner or operator

Why now

Replace repeated handoffs with one measurable flow

How we sell

Founder-led pilots, restaurant advisors and referrals

Expansion gate

Saudi pricing follows ZATCA, VAT and local payment acceptance

Pro and multi-branch features remain gated until implemented and validated.

A testable Egypt Growth scenario produces 240% modeled ROI

Illustrative scenario, not measured results

Subscription

1,499

EGP / month

vs

Measurable benefit

5,100

EGP / month

=

Net benefit

3,601

EGP / month

240%

MODELED ROI

Benefit assumptions

20 admin hours × EGP 75 =
1,500

0.4% × EGP 600k sales = 2,400

8 checks × EGP 500 × 30% = 1,200

ROI = (5,100 - 1,499) ÷ 1,499 × 100 = 240.2%, rounded to 240%

Excludes hardware, gateway fees, tax and setup fees if any.

The next 90 days turn working software into a sellable service

Current progress narrows the plan; production gates remain explicit

NOW

0-30 DAYS

31-60 DAYS

61-90 DAYS

Working MVP

Egypt pilot

Production hardening

Saudi gate

Build passes
76 tests pass
Live Gemini verified

3 restaurants
7-day baseline
Measured adoption +
ROI

Firebase emulator
isolation
Subscription billing
Monitoring +
recovery

Local tax review
ZATCA integration
Payment acceptance

Sustainability

Per-branch subscriptions fund maintenance; AI usage limits, caching, monitoring and a manual fallback control operating cost.

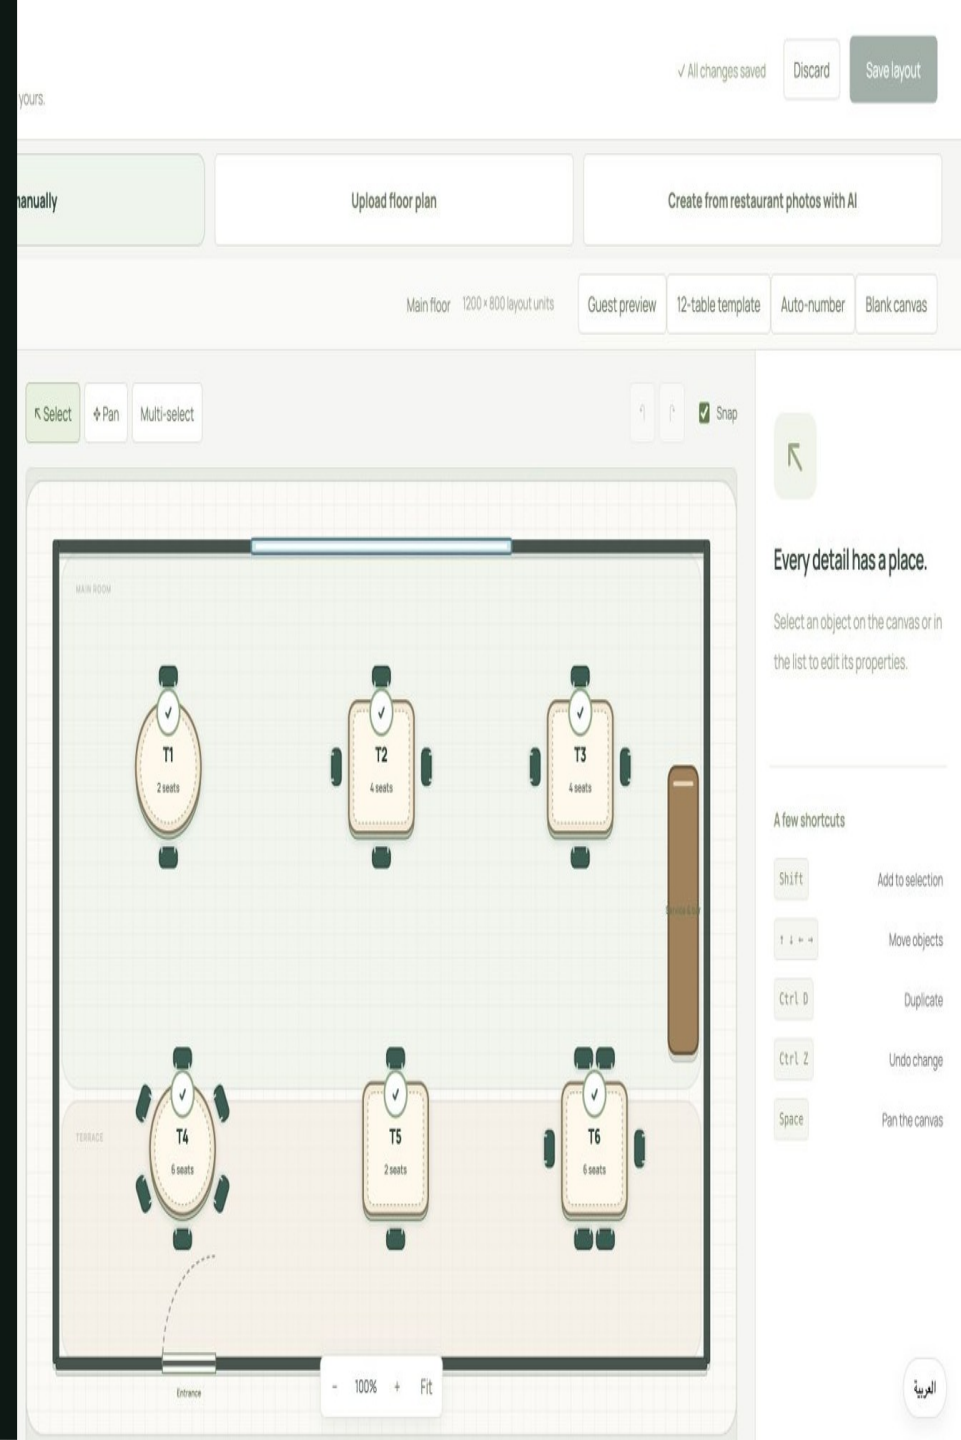

The ask

Three restaurants. Thirty days. Measured impact.

Support a 30-day Egypt pilot to turn a connected working product into verified operating improvement and a commercial decision.

Baseline → adoption → ROI → purchase decision

Resuto · restaurant operations connected

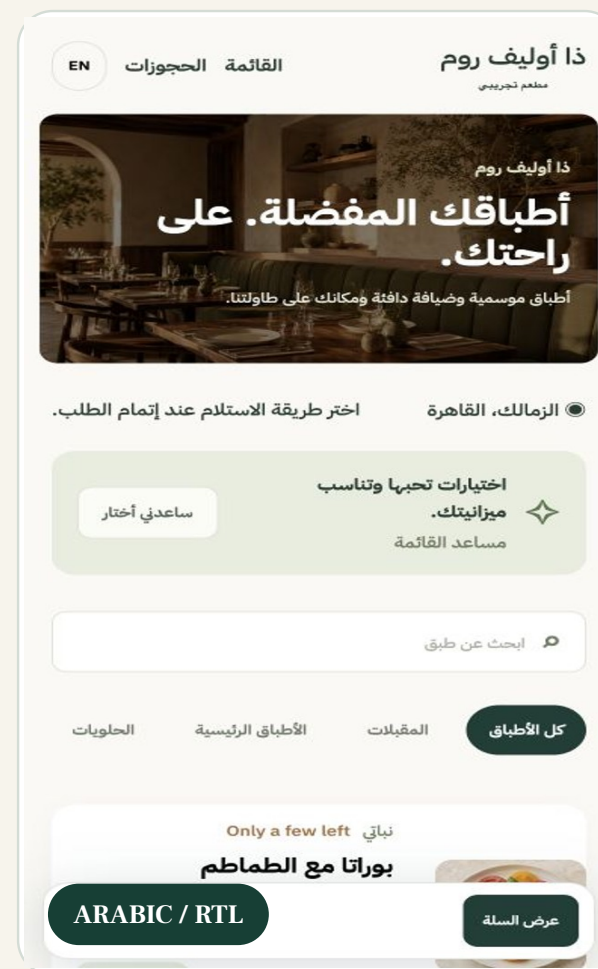

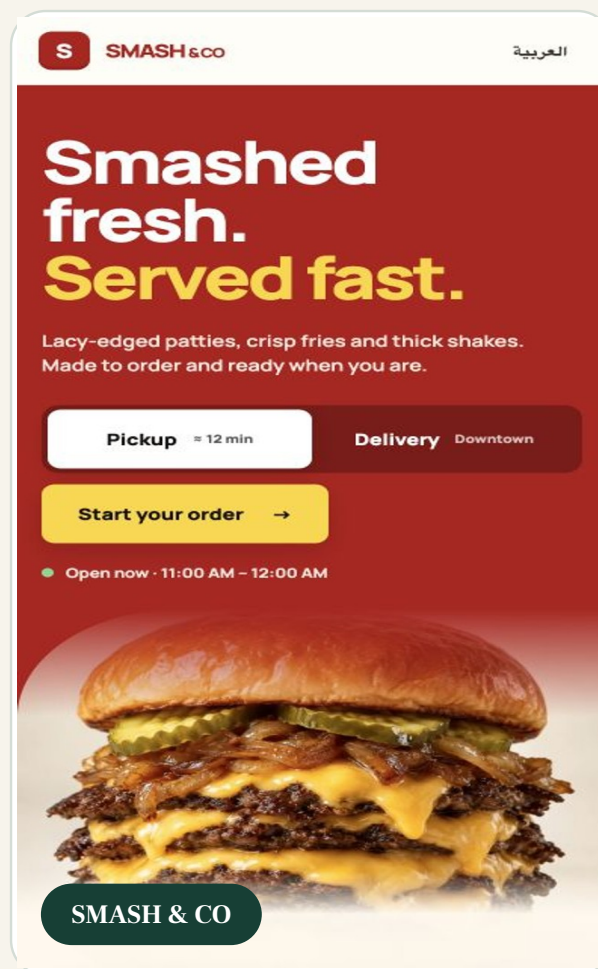

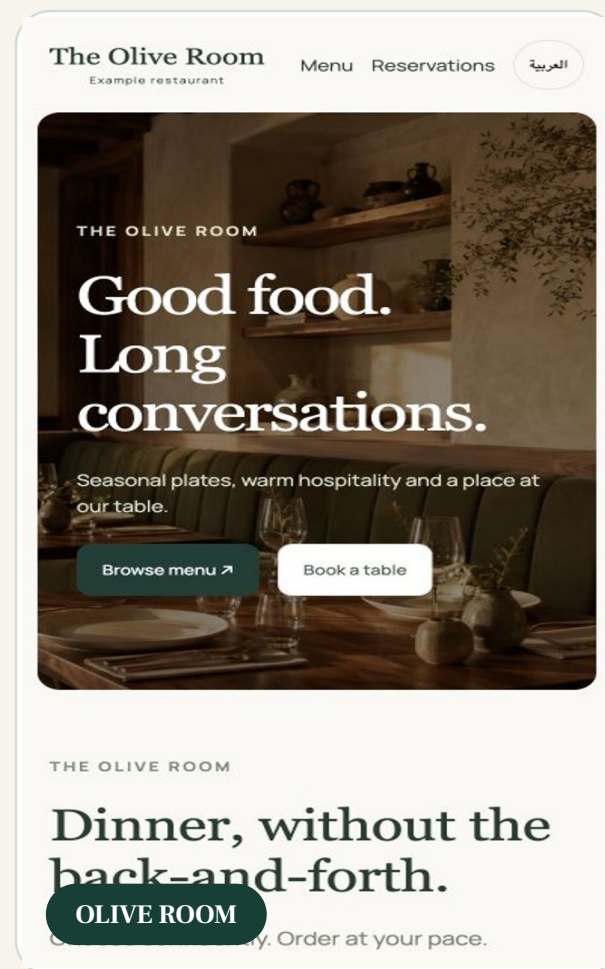

Verified feature map

Working, demo/sandbox and gated status are separated explicitly

Role / area	Working now	Demo or sandbox	Production gate
Guest	Reservations, exact table choice, QR menu, cart, order tracking, Arabic/English	Live Gemini recommendation; demo restaurant content	Real device and accessibility audit
Kitchen	Station routing, guarded order transitions, pickup/delivery and live polling	Synthetic service data	Offline queue, printer and drawer integration
Manager	Floor editor, menu, stock, reservations, data import/export, insights	Live Gemini draft; AI image capability depends on model configuration	Monitoring, recovery and operational runbook
Owner / SaaS	Firebase account, membership and tenant code; branch and trial records	Local demo is a single restaurant installation	Emulator isolation pass, subscription lifecycle and acceptance testing
Payments	Test ledger, splits, receipts, Stripe/Paymob adapters and signed callbacks	No real charge in the captured flow	Merchant credentials, settlement and refund acceptance

One platform, restaurant-specific presentation

The Olive Room and Smash & Co are fictional demo restaurants, not customers

Resuto
stays the
platform
brand

Themes can
reflect service
model and
restaurant
identity without
changing the
operating core.

Authentication, roles and tenant isolation

The hosted path is implemented in code; production proof remains gated

Concern	Local demo	Firebase tenant mode	Current evidence
Authentication	Opaque staff cookie	Firebase ID token	Code + local role tests
Roles	Manager, kitchen, host	Owner, manager, kitchen, host memberships	Role restrictions pass
Restaurant selection	Single installation	Membership selects exactly one restaurant	Code review
State storage	SQLite state document	restaurants/{id}/private/state	Code review
Client data access	Server API only	Firestore rules deny operational state	Rules inspected
Isolation test	Guest and staff scope tests pass	Emulator test skipped today	Release gate

Hosted mode must pass emulator isolation, backup/restore and incident-response rehearsal before production launch.

Gemini controls and fallback behavior

AI output stays bounded by restaurant data and explicit human action

Guest recommendation

Input	Menu IDs, price, stock, budget, party and exclusions
Validation	Known IDs, available quantity and total under budget
Action	Guest adds the meal and confirms the order

Manager extraction

Input	PDF, image or text treated as untrusted source data
Validation	Structured schema, confidence, missing prices and uncertain fields
Action	Manager edits, approves and publishes separately

Provider failure

Signal	Timeout, unavailable provider or invalid structured response
Fallback	Labeled demo rules or a clear error; no state change
Recovery	Manual menu and ordering paths remain available

Live evidence: EGP 685 recommendation under a EGP 700 limit; a menu review draft created with nothing published.

Proposed pricing by market

All figures come from the dated judging pack and remain commercial hypotheses

Egypt	Monthly before tax	Illustrative with 14%
Starter	EGP 799	EGP 910.86
Growth	EGP 1,499	EGP 1,708.86
Pro	EGP 2,999	EGP 3,418.86
Business	Custom	By proposal

Egypt annual offer in pack: pay 10 months. Add-ons proposed after demand proof.

Saudi Arabia	Target before VAT	90-day founder	With 15% VAT
Starter	SAR 199	SAR 149	SAR 228.85
Growth	SAR 399	SAR 299	SAR 458.85
Pro	SAR 699	SAR 499	SAR 803.85

Saudi go-live gate

Do not sell Resuto as a compliant Saudi POS until ZATCA, local tax treatment and payment acceptance are complete.

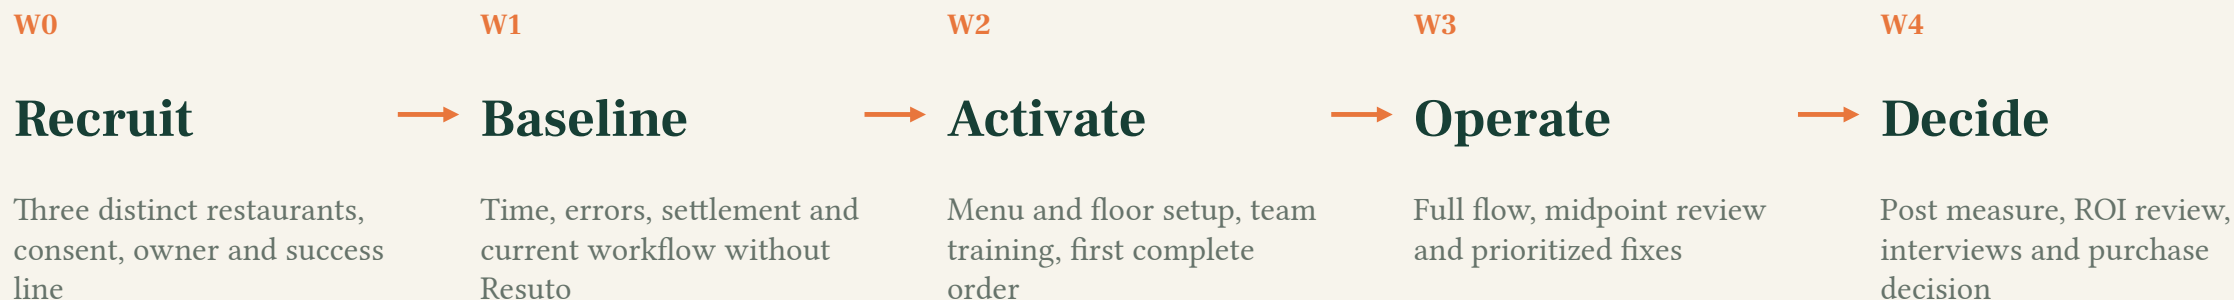

Egypt Growth ROI assumptions

The pilot replaces each model input with measured data

Benefit component	Illustrative calculation	Monthly value	Pilot measurement
Admin time	20 hours × EGP 75	EGP 1,500	Timed baseline vs system events
Avoided error / waste	0.4% × EGP 600k sales	EGP 2,400	Logged corrections with reason codes
Incremental contribution	8 checks × EGP 500 × 30%	EGP 1,200	Contribution margin, not gross sales
Total benefit	Sum of three components	EGP 5,100	Exclude unsupported attribution
Subscription	Growth package	EGP 1,499	Before tax
Net benefit	5,100 – 1,499	EGP 3,601	Reported monthly
Modeled ROI	3,601 ÷ 1,499 × 100	240.2%	Rounded to 240%

Pilot measurement and go-to-market

A commercial decision closes the feedback loop

Commercial success

One paid conversion; two letters of intent or extensions; documented pricing objections

Unit economics targets

Track activation, retention, support time and AI cost first. Calculate LTV/CAC only after real cohorts exist.

Production readiness register

Highest-impact risks come before feature expansion

Firestore tenant isolation	CRITICAL	Run emulator suite and authorization matrix	Before pilot accounts
Real payments and refunds	HIGH	Merchant sandbox, settlement and refund acceptance	Before live money
Monitoring and recovery	HIGH	Logs, alerts, backup/restore and incident runbook	Before production
Offline operations	HIGH	Queue, printer/drawer path and manual fallback rehearsal	After pilot / before scale
Egypt / Saudi compliance	HIGH	Local specialist review and acceptance testing	Before commercial launch
Accessibility	MEDIUM	Keyboard, screen reader, contrast and Arabic testing	Pilot hardening
Team adoption	MEDIUM	45-minute training, restaurant champion, activation tracking	During pilot

Likely judging questions

Short answers grounded in current evidence

What is different from a POS?

Resuto connects the guest journey and operating state, with table geometry and reviewed AI inside the work flow. It does not claim to replace every production POS today.

Is the ROI proven?

No. The slide is an illustrative model. The pilot records a baseline, measures post-adoption events and ties continuation to evidence.

Why this price?

It sits below the pack's dated Egypt benchmark and reflects MVP scope. Willingness to pay remains a pilot question.

Does multi-restaurant isolation work?

Firebase membership and tenant storage code exists. The emulator isolation test was skipped today, so production launch remains gated.

What happens when Gemini fails?

The system validates output and returns labeled demo rules or a clear error. It does not publish or place an order automatically.

Can you operate in Saudi Arabia?

Only after local tax review, ZATCA integration and payment acceptance. The proposal treats Saudi Arabia as a gated expansion.

Judging coverage and source trail

Every core criterion maps to a main slide and a verifiable source

Criterion	Main slide	Evidence
Problem definition	2	Pack positioning + explicit research limitation
Impact / SDG	8	Pilot KPIs, baseline and SDG 8 link
Innovation	3, 6	Connected state + Gemini inside reviewed workflows
Solution / UX	4, 5	Fresh mobile and kitchen runtime captures
Technical implementation	5, 7	Real state transition, architecture and passing tests
Feasibility	11	90-day gated execution plan
ROI / business model	9, 10	Per-branch price and transparent calculation
Sustainability	11	Revenue-funded maintenance and cost controls
Presentation	1–12	340-second timed main narrative
